
 WHITEPAPER · NAMESPACE GOVERNANCE

Actionable intelligence, never before possible

How Klarvant gives organisations visibility and control over the domains, subdomains, and digital identifiers that form their public footprint online.

The digital landscape is still not fully understood

In a connected economy of billions of computers and other electronic devices, the digital landscape is yet to be fully understood, protected, and monitored by organisations across the globe. Klarvant's combined cyber experience, spanning more than 100 years, means it understands that namespace governance brings together many of the technologies, processes, and controls that companies already deploy. Using its proprietary technology, Klarvant analyses the public internet, more than 7 billion domains and digital identifiers globally, and helps organisations cut through that complexity.

When digital attacks change constantly and persistently threaten online interactions, Klarvant's goal is to help organisations retain visibility and control over their digital identifiers: domains, subdomains, and other digital assets.

The freedom to create digital identifiers such as subdomains is driving unprecedented growth in unregulated and unmanaged identifiers, which together form the public footprint of a company online. Unless they are managed and protected, this digital backbone leaves an open door to criminals.

LEFT UNMANAGED, THIS DIGITAL BACKBONE OPENS THE DOOR TO

Corporate identity
theft

Ransomware

Phishing

DNS hijacking

DNS tunnelling

INDUSTRY VIEW

'By 2026, organisations that prioritise their security investments based on a continuous exposure management programme will be three times less likely to suffer a breach.'

GARTNER · HOW TO MANAGE CYBERSECURITY THREATS, NOT EPISODES · AUGUST 2023

Intelligence that drives action

Klarvant Namespace Command is a zero-integration digital governance platform: one live dataset, five doors in (the web platform, CSV and JSON export, a REST API, MCP for AI assistants, and A2A on the open agent standard). Implementation is frictionless and requires no integration. Through its advanced analytics, Klarvant predicts and identifies risk. It prioritises the most impactful findings and advises on the remediation needed to achieve compliance.

Klarvant's approach to namespace governance reinforces existing technology and security investments. It helps organisations safeguard their corporate identity by mitigating risk, improving operational efficiency, and delivering cost savings. Klarvant also protects brand reputation and strengthens customer trust.

THE KLARVANT DIFFERENCE

Frictionless SaaS workflow: Discover > Identify > Analyse > Govern > Comply. Predictive analytics that prioritise the most impactful findings. Clear remediation guidance that reinforces existing investments. Stronger corporate identity, brand reputation, and customer trust. Best-in-class client support and account management, coupled with continuous platform improvement.
